COLONOSCOPY

Some Things You Should Know.....

WHAT IS A COLONOSCOPY?

Colonoscopy is an examination of the large intestine using a long flexible tube called a colonoscope. This test may be done for a variety of reasons. Commonly it is done to investigate the finding of blood in the stool, diarrhea, abdominal pain, a change in bowel habits, or an abnormality noted on a colon x-ray or barium enema.

WHAT HAPPENS DURING THE PROCEDURE?

An intravenous (IV) will be started in your arm. Enough medication will be given to make you drowsy and relaxed.

The examination is performed with you lying on your left side. The doctor will examine your rectum first with a finger and then the colonoscope will be gently inserted. The colonoscope will be carefully passed through the colon and then slowly withdrawn.

If any abnormalities are found, small pieces of tissue may be taken for examination. Small growths (polyps) may also be found in the colon and can safely be removed. Small bleeding sites are often cauterized (burned) to stop bleeding. This is a very safe procedure and in many cases eliminates the need for surgery.

Your stay at the facility will be approximately three hours long, depending on how long it takes to pass the scope around the colon. When medication is given, the procedure is usually not unpleasant and often the patient does not remember having the procedure done.

AFTER THE PROCEDURE:

You will be observed for about thirty minutes before going home. You will not be allowed to drive after the procedure. You will be drowsy several hours afterward. Following the colonoscopy, the doctor will talk with you and your family and give them a report of the test findings. A follow-up visit should have been pre-scheduled so the test results can be explained to you when you are fully awake at a later date. This follow-up visit is separate from the procedure and if your insurance requires a co-pay it will be due on the day of the follow-up visit.

RISKS:

This is a very safe examination, but there is a small risk of complications, which occur in less than 1% of patients. Reactions to medications may occur. These might be allergic reactions or difficulty breathing. Bleeding is a possibility. Perforation of the colon may occur. A perforation is a serious problem and in some cases would require surgery to close the perforation of the colon.

If you experience severe pain, bleeding, or any problems after the test, please contact the doctor at (239) 275-8882 immediately.
